STRUCTURAL FEATURES IN ILLINOIS – A COMPENDIUM

INTRODUCTION

The following three lists of structural names and the accompanying map (pl. 1) constitute a compendium of nearly all of the structural features in Illinois that have been formally named in the literature. Much of the mapping in the past has been initiated by the search for oil and gas, coal, fluorspar, lead and zinc, and other mineral resources. This map reflects trends in mineral exploitation and, consequently, indicates areas where detailed geologic studies have been made.

Structural delineations on the map have been taken directly from the literature; therefore, the mapping horizon may differ from one structure to another. Although many of the structural features are shown to terminate at the state line on this map, most of them are known or suspected to continue into the adjacent states. There has been no attempt in this compilation to remap any structures on the basis of new data or new interpretations.

Formally named structures

The first list consists of formally named structures. They are listed alphabetically and are followed by their locations (in parentheses), and references to original and major works on the structures. A few of these structures are not delineated on the map because they have not been substantiated by more recent mapping; an asterisk appears in front of their names. An asterisk also appears in front of names that have been replaced by newer names (the new names appear in parentheses after the former names). These structures with two names are listed twice—by the old and new names.

The structures of the Fluorspar Area Fault Complex have been treated differently because of their complexity. As many faults as possible from this area have been delineated on the map, and all of the formal structural names

within the complex are listed. With the exception of a few major features, however, the names are not indicated on the map because of a lack of space.

Named Silurian reefs are included in this compendium although they are not tectonically generated structures.

Significant unnamed structures

Following the list of formally named structural features is a list of significant unnamed structures. This list includes two types of features. The first type (no. 1-13) consists of unnamed structural highs that are well delineated in published maps, and were selected because they were too large to be omitted. In all cases, the names given in the list refer to the oil field associated with the structure; only the identifying number appears with the delineation of the structure on the map. Many other known, but unnamed, structural features that are associated with oil fields (Van Den Berg, 1980) have been omitted.

The other type of feature (no. 14-19) consists of faults that appear on published maps, but have not been formally named. Besides these, there are still other faults that have been mapped and are documented only in unpublished field notes. Most of these are minor faults found in underground mines.

Buried Precambrian hills

The third list of structural features contains the names and locations of all of the drill holes in Illinois that have encountered buried Precambrian hills. Although these hills are paleotopographic features, they generally correspond with structural highs in the younger Paleozoic rocks.

The list of references follows at the end.

FORMALLY NAMED STRUCTURES

Structural names are followed by their locations (in parentheses) and references to original and major works on the structures.

* An asterisk means one of two things: the structure is not delineated on the map, or the structure's name has been replaced by the new name that appears in parentheses after it. In the latter case, references are listed after the new name.

ACKNOWLEDGMENTS

I thank Hubert M. Bristol, Geologist Emeritus of the Illinois State Geological Survey (ISGS), for his efforts in the early 1970s in compiling a card file of all the structural features in Illinois. This file, modified and updated, served as a basis for this compendium. I also thank Richard H. Howard and Dennis R. Kolata of the ISGS for their support and advice throughout the course of this project. In addition, the suggestions and comments of Howard R. Schwalb, Wayne F. Meents (Geological Engineer Emeritus), and W. John Nelson, all of the ISGS, and Thomas C. Buschbach, of St. Louis University, were greatly appreciated.
