ST. LOUIS (MISSISSIPPIAN) OIL PRODUCTION  
IN JASPER COUNTY, ILLINOIS

H. M. Bristol and R. H. Howard

ABSTRACT

A well in the St. Louis Limestone in Jasper County, Illinois, was completed in December 1965 for 538 barrels of oil a day, flowing from a dolomite zone at a depth of 2940 to 2961 feet. The well, Union Oil Company of California No. 1 Leo Menke "A", is located at the northern end of the Clay City Consolidated pool.

As a result of extensive drilling and testing of the St. Louis Limestone stimulated by this discovery, 16 producers have already been completed in the St. Louis that have initial production ranging from 140 to 1200 barrels of oil per day.

The probable presence of an active water drive suggests that St. Louis production along the 45-mile-long Clay City Anticline will be controlled in part by local structural conditions.

St. Louis production, much of it minor, from 26 other widely scattered pools indicates the St. Louis is a potential target in much of the Illinois Basin.

INTRODUCTION

On December 17, 1965, Union Oil Company of California completed its No. 1 Leo Menke "A" for 538 barrels of oil per day flowing from a dolomite zone in the St. Louis Limestone at a depth of 2940 to 2961 feet. The well is located in the E/2 NW NW, sec. 34, T. 7 N., R. 10 E., Jasper County, at the northern end of the Clay City Consolidated pool (figs. 1 and 2).

During the summer of 1965, many wells in the immediate vicinity of the Leo Menke lease had been deepened from their nearly depleted McClosky or shallower pays to dolomite zones 80 to 125 feet in the Ste. Genevieve Limestone. These dolomite zones, some 150 feet above the St. Louis producing zone in the No. 1 Leo Menke "A", initially produced

\* Pool numbers are same as shown in figure 1; C = Consolidated.

Fig. 1 — St. Louis oil production in Illinois (see table 1 for pool names)

Fig. 2 — Structure on base of Beech Creek (Barlow) Limestone; deep St. Louis tests and locations are indicated (not all control points are shown).

25 to 100 barrels of oil per day, and their success set the stage for the St. Louis discovery in the No. 1 Leo Menke "A" that has stimulated extensive drilling and testing of the St. Louis section in Jasper County. A list of holes penetrating the new St. Louis pay zone appears in appendix 1, and recent locations appear in appendix 2.

This report briefly discusses the St. Louis production in Jasper County and indicates the widely scattered areas of previous St. Louis production in Illinois. It summarizes information that may be helpful in future exploration for St. Louis oil in the Illinois Basin.

#### ST. LOUIS OIL PRODUCTION

The first St. Louis oil production in Illinois was from the Westfield, Casey, and Martinsville pools (numbers 26, 3, 19, respectively, in fig. 1). These pools were discovered along the LaSalle Anticlinal Belt between 1900 and 1907. Subsequently, 24 additional pools produced oil from the St. Louis (table 1). Although no complete St. Louis production figures are available, several pools are known to have produced hundreds of thousands of barrels of St. Louis oil.

#### St. Louis Production in Jasper County

##### Stratigraphy

The geologic section in the Union Oil Company of California No. 1 Leo Menke "A" is shown in figure 3. The thicknesses given for the formations down through the St. Louis are based on a sample study by Elwood Atherton of the Illinois State Geological Survey. The part of his study that includes strata from Downeys Bluff Limestone to total depth appears as appendix 3 to this report. The electric log and drilling time log from the Yankeetown Sandstone to total depth are shown in figure 4.

The top of the St. Louis Limestone is marked by the appearance of anhydrite and dark brown limestone that forms a contrast to the grayish brown limestone of the overlying Ste. Genevieve.

The producing interval in the No. 1 Leo Menke "A" is a 21-foot, light brown to brown, extra-fine dolomite 194 feet below the top of the St. Louis and 340 feet below the top of the Ste. Genevieve. Several other dolomite breaks with shows of oil occur in the St. Louis above and below this producing zone, as indicated on the electric and drilling time logs (fig. 4).

The base of the St. Louis is difficult to pick from the electric log, but examination of the well cuttings from the No. 1 Leo Menke "A" shows it to be at 3096 feet, 13 feet above a porous Endothyra zone of the Salem that is generally recognizable on the electric log. The upper 13 feet of the Salem is light brownish gray, oolitic limestone in which the ooliths have dark centers.

## Structure

St. Louis production in Jasper County is in the Clay City Consolidated pool (fig. 1). This is a series of pools extending from Hunt City at the north (fig. 2) to Fairfield in Wayne County, some 45 miles southwestward. The pools are located on a succession of southward-plunging anticlinal noses that compose the Clay City Anticline (often called the "Pure Trend").

## Oil Production

The Pure Oil Company originally completed the No. 1 Leo Menke "A" in 1946 as dry and abandoned, 115 feet into the Ste. Genevieve (total depth 2715 feet). In 1957 it was deepened through the St. Louis and 74 feet into the Salem Limestone (total depth 3171 feet). Although the Salem was drill-stem tested, the St. Louis was not, and the well was again abandoned. In December 1965, Union Oil Company of California, which had absorbed the Pure Oil Company in 1965, re-entered the old hole, perforated the 2940- to 2953-foot interval of the St. Louis with 26 shots, and treated it with 8000 gallons of acid. The well came in for an initial production of 538 barrels of oil per day, flowing through a 10/64-inch choke. Six weeks later it had produced over 10,000 barrels of oil and was still flowing 175 barrels of oil and 3 barrels of salt water per day.

Since the completion of the Menke well 16 other St. Louis producers have been completed in the vicinity. Reported initial production figures range from 140 to 1200 barrels of oil per day. An oil sample from the No. 1 Leo Menke "A" that was analyzed by the Geological Survey's Analytical Chemistry Section had a gravity of 39.60° API at 60° F. Other reported gravities have ranged from 39.0° to 41.4°.

Wells structurally lower than the No. 1 Leo Menke "A" are producing much salt water. This suggests an active water drive. Many large flares indicate that solution gas also is helping to drive the oil.

## Completion and Production Practices

General practice in completing and producing these wells has been to set pipe through the pay, perforate, and treat with 5000 to 10,000 gallons of acid. Some of the work-over wells (previously producing from McClosky or shallower pays) have been completed by drilling a slim hole below the original production string and then running 2½-inch pipe set on a packer, perforating, and then acidizing. The Pure Transportation Company (a division of Union Oil Company of California) and Ashland Oil Company are taking the oil from this area and are paying on a basis of \$3.10 per barrel for 40° gravity oil with a 2-cent per barrel drop per degree of gravity from 39.9° to 38.0°, then a 3-cent per barrel drop per degree below 37.9°.

## CONCLUSIONS

The recent discovery of prolific St. Louis producers in Jasper County, significant in itself, should lead to a re-examination of St. Louis

possibilities throughout the Illinois Basin. Although a majority of pools producing from the St. Louis have had only one St. Louis well, St. Louis production is widely scattered and therefore is a potential target over much of the basin. It would be especially attractive in old pools that have reached their economic limit producing from shallower pays.

Dolomite production from the St. Louis in the vicinity of the No. 1 Leo Menke "A" may have an active water drive. This suggests that oil production along the Clay City Anticline will be controlled in part by local structural conditions.

APPENDIX 3

Summary Sample of Downeys Bluff to Salem Section of the  
Union Oil Company of California No. 1 Leo Menke "A"

by Elwood Atherton

(Depths adjusted to 1957 electric log)

Strata		Thickness (ft)	Bottom depth (ft)
Mississippian System			
Chesterian Series			
Downeys Bluff Limestone	Limestone, light olive gray, fine to coarse; trace of chert	8	2498
Yankeetown ("Bencist") Sandstone	Sandstone, slightly hematitic to very hematitic, light gray to red, very fine, angular, friable	7	2505
	Sandstone, hematitic, reddish gray to red, very fine, angular, friable	22	2527
	Shale, dark gray, red	8	2535
Renault Limestone	Limestone, oolitic, medium light brownish gray, medium to coarse	6	2541
Valmeyeran Series			
Aux Vases Sandstone	Shale, dark gray, red	23	2564
	Sandstone, calcareous in part, light olive gray, light gray, very fine to fine, few medium grains, angular, compact, in part with fine to coarse brownish gray limestone grains, in part with oil show	8	2572
	Sandstone, calcareous, light gray, very fine, angular, friable; sandstone, as above	8	2580
	Sandstone, very dolomitic, brownish gray, very fine, compact; grading to dolomite, gray, extra-fine	6	2586
	Shale, dark gray, red	14	2600
Ste. Genevieve Limestone	Limestone, medium dark brownish gray, extra-fine, dense, in part with fine to medium light fossil grains; trace of chert	6	2606
	Limestone, brownish gray, light gray, white, fine to coarse, fossiliferous; trace of chert	4	2610
	Limestone, medium dark brownish gray, dense, with few dark grains; slightly cherty	5	2615

APPENDIX 3 - Continued

Strata	Thickness (ft)	Bottom depth (ft)
Limestone, as above; grading to sandstone, very calcareous, dark brownish gray, very fine, compact	8	2623
Limestone, oolitic, light olive gray, light gray, fine to medium, in part porous, oil show ("McClosky")	5	2628
Limestone, oolitic, light olive gray, fine to medium, in part very finely sandy	15	2643
Limestone, very sandy, light olive gray, very fine; grading to limestone, oolitic, as above	14	2657
Limestone, slightly cherty, medium light brownish gray, sublithographic	8	2665
Limestone, medium light brownish gray, fine to coarse, dense; trace limestone, very dolomitic, extra-fine	5	2670
Limestone, medium light brownish gray, sublithographic	6	2676
Dolomite, calcareous, light brownish gray, extra-fine	4	2680
Limestone, oolitic, medium light brownish gray, medium; limestone, medium light brownish gray, sublithographic	10	2690
Limestone, medium light brownish gray, dense to sublithographic, in part obscurely oolitic, fine; little limestone, very finely sandy	5	2695
Limestone, brownish gray, dense to sublithographic	4	2699
Dolomite, calcareous, light gray to brownish gray, extra-fine	2	2701
Limestone, oolitic, grayish brown, fine to coarse	4	2705
Limestone, medium light brownish gray, obscurely granular, in part extra-finely dolomitic	10	2715
Limestone, grayish brown, dense to sublithographic, in part very finely sandy	7	2722
Dolomite, grayish brown, gray, extra-fine; oil show in part; trace of chert	4	2726
Limestone, sandy, obscurely oolitic, grayish brown, fine to medium with very fine to medium sand grains	4	2730
Limestone, very finely sandy, grayish brown, fine	5	2735
Limestone, sandy, in part obscurely oolitic, grayish brown, brownish gray, fine to medium; little dolomite, light brown, extra-fine; oil show	9	2744
St. Louis Limestone		
Limestone, dark brown, fine to medium; contains anhydrite, dark brown; trace of oil	6	2750
Limestone, as above; limestone, very dolomitic, brownish gray, extra-fine	5	2755

APPENDIX 3 - Continued

Strata	Thickness (ft)	Bottom depth (ft)
Limestone, dolomitic in part, medium to light brownish gray, mostly fine	10	2765
Limestone, slightly dolomitic, light brownish gray, fine to coarse; trace of chert; little limestone, dark brown, fine to medium; anhydrite	5	2770
Limestone, slightly cherty, medium to light brownish gray, mostly fine, in part slightly dolomitic	5	2775
Limestone, cherty, slightly dolomitic, light brownish gray, mostly fine; dolomite, cherty, brownish gray, extra-fine	10	2785
Limestone, light to medium light brownish gray, dense to sublithographic	5	2790
Dolomite, medium light brownish gray, very fine	10	2800
Limestone, medium light brownish gray; dolomite, as above; dolomite, grayish brown, extra-fine	10	2810
Limestone, light brownish gray, sublithographic; trace of chert; dolomite, brown, extra-fine	16	2826
Dolomite, brown, extra-fine	5	2831
Limestone, cherty, grayish brown, dense	14	2845
Limestone, grayish brown, dense to sublithographic; limestone, cherty, light brownish gray, fine to coarse	7	2852
Dolomite, light brownish gray, extra-fine	2	2854
Limestone, cherty, grayish brown, dense; trace of oil	8	2862
Limestone, grayish brown, fine to medium, with little very fine sand and coarse silt	5	2867
Limestone, grayish brown, very fine to medium, rather dense; little very fine sand, in part obscurely oölitic; trace of oil	9	2876
Dolomite, light brown, extra-fine; oil show	4	2880
Limestone, grayish brown, very fine to medium, rather dense	6	2886
Dolomite, brown, extra-fine	2	2888
Limestone, grayish brown, sublithographic; anhydrite, white	4	2892
Limestone, grayish brown, mostly fine, dense; trace of oil; anhydrite, white	4	2896
Limestone, obscurely oölitic in part, grayish brown, fine to medium, rather dense; trace of oil	4	2900
Dolomite, brown, grayish brown, very fine to extra-fine	4	2904
Limestone, medium light brownish gray, sublithographic; dolomite, brown; trace of oil	7	2911

APPENDIX 3 - Continued

Strata	Thickness (ft)	Bottom depth (ft)
Limestone, light brownish gray, fine to medium, dense; dolomite, brown to gray, light brownish gray, very fine to extra-fine	7	2918
Limestone, brown, sublithographic; contains dark brown anhydrite; anhydrite, white	20	2938
Dolomite, light brown, brown, extra-fine; oil show	21	2959
Limestone, brown, sublithographic	10	2969
Limestone, dolomitic, oclitic in part, dark brown, fine to coarse	5	2974
Limestone, dolomitic in part, brown, with dark brown anhydrite	5	2979
Limestone, dark to light brown, dense to sublithographic	10	2989
Limestone, dark brown, dense to sublithographic	5	2994
Limestone, brown to dark brown, sublithographic	4	2998
Dolomite, brown, very fine to extra-fine; oil show	2	3000
Limestone, dark brown, sublithographic; trace of limestone, obscurely oclitic, medium to coarse	5	3005
Limestone, silty, dark brown, dense, fossiliferous in part; trace of limestone, oclitic, brownish gray, dark brown, medium to coarse	5	3010
Limestone, dark brown, sublithographic, with dark brown anhydrite	10	3020
Limestone, silty, dark brown, dense	5	3025
Limestone, silty in part, dark brown, dense to sublithographic	5	3030
Limestone, silty in part, dark brown, rather dense, with dark brown anhydrite; limestone, grayish brown, in part obscurely oclitic	14	3044
Dolomite, light brown, very fine to extra-fine; oil show	4	3048
Limestone, silty, dark brown, brownish gray, dense to sublithographic	4	3052
Limestone, silty, medium to dark brownish gray, little dark gray, dense	10	3062
Limestone, silty, dark grayish brown to medium dark brownish gray, dense, with dark brown anhydrite	4	3066
Dolomite, calcareous, light brownish gray, extra-fine, with little anhydrite, white; limestone as above	12	3078
Limestone, medium dark brownish gray, dense to sublithographic, with dark brown anhydrite	10	3088
Dolomite, calcareous, gray, extra-fine; little anhydrite, white	5	3093

APPENDIX 3 — Continued

DEPARTMENT OF GEOLOGY AND MINERALS  
ILLINOIS STATE PETROLEUM SURVEY

Strata	Thickness (ft)	Bottom depth (ft)
Limestone, silty, medium dark brownish gray, extra-fine	4	3097
Salem Limestone		
Limestone, oolitic, medium dark brownish gray, light gray; contains dark ooliths, fine to coarse, mostly medium	13	3110
Limestone, oolitic, light brownish gray with brown and dark gray oolith centers, fine to coarse, fossiliferous, with <u>Endothyra</u> (dark gray); trace of oil	32	3142
Limestone, as above, grading to dolomite, medium light brownish gray, extra-fine	16	3158
Limestone, very dolomitic in part, brownish gray, little light gray, dark gray, fine to coarse, very fossil- iferous, <u>Endothyra</u>	14	3172
Limestone, oolitic, dolomitic in part, light brownish gray with brown- and dark gray-centered ooliths, fine to coarse, fossiliferous	4	3176
